

Press Release 20.11.2008

iLoq wins the Detektor International 2008 Award

iLoq Ltd. from Finland has won the Detektor International Award 2008 in the category "Access Control Products". The award was appointed in connexion with Sectech fair in Copenhagen. The winner was chosen by a jury of international journalists at Detektor Magazine and independent security experts.

The winning solution iLoq S10 integrates modern mechatronics with communication and software technologies enabling a new level of high-security throughout the lifetime of a locking system.

Sales & Marketing Director Michael Szücs considers iLoq's success in the competition yet another acknowledgment for company's innovativeness. "It proves that we have managed to develop a new kind of solution that offers benefits not only for locking purposes but for access control as well."

The core of the electronically keyed iLoq S10 locking system is the unique electromechanic iLoq C10 lock cylinder which replaces existing mechanical lock cylinders. Both the lock cylinder and the key look ordinary but function digitally. The system is self-powered – The electricity needed is harvested from insertion of the key. As no batteries or electric wiring are required, the locks and the keys are easy to install and maintain, and the system is an environmentally friendly "green" solution.

With its easy-to-use and flexible access control management iLoq S10 breaks down the limits of traditional key management systems. As a result – besides an increased security – unbeatable cost and logistic advantages can be realized in existing and new master-key locking applications for industrial facilities, office, public and rental apartment buildings.

Earlier this year iLoq received the first prize in its series "Physical security product of the year" in the international IFSEC Security Industry 2008 event in Birmingham, UK. Recently iLoq was awarded with a regional 1st prize in the InnoSuomi 2008 –competition and is nominated for the national prize.

iLoq Ltd. develops, manufactures and markets advanced high security electronic locking solutions integrating modern mechatronics with communication and software technologies in innovative ways. The core of iLoq locking systems is a self-powered electromechanic lock cylinder that replaces existing mechanic lock cylinders. iLoq locking systems offer superior keying, maintenance, lifecycle and cost benefits whilst saving environment.
